Images & turbulence — 08

The wavefront is, modulo $\lambda/2\pi$, proportional to the phase $\Phi(r)$ of the wave $\Psi(r)$ which has went through the turbulent atmosphere before reaching the telescope:

$$\Psi(\vec{r}) = A(\vec{r})\exp\{\imath\Phi(\vec{r})\}$$

Note that this phase can be decomposed following a base of polynomials, for example Zernike ones:

$$\Phi(\vec{r}) = \sum_i a_i\, Z_i(\vec{r})$$

turbulence intensity [$m^{1/3}$]

$$r_0 = 0.185\ \lambda^{\frac{6}{5}}\ \cos(\gamma)^{\frac{3}{5}}\ \left[\int_0^\infty C_n^2(z)\ dz\right]^{-\frac{3}{5}}$$

dimension of r_0 ? value in band H knowing r_0 at 500nm (10cm) ?...

$$\tau_0 = 0.36\,\frac{r_0}{\bar{v}}$$

$$\bar{v} = \left(\frac{\int C_n^2(h) v(h)^{\frac{5}{3}} dh}{\int C_n^2(h) dh}\right)^{\frac{3}{5}}$$

$$\epsilon_0 = 0.98\,\frac{\lambda}{r_0}$$

$$\theta_0 = 0.314\ \frac{r_0}{\bar{h}}$$

$$\bar{h} = \left(\frac{\int C_n^2(h) h^{\frac{5}{3}} dh}{\int C_n^2(h) dh}\right)^{\frac{3}{5}}$$

$$N_s \simeq 0.34\left(\frac{D}{r_0}\right)^2$$

Number of speckles for r_0=10cm and D=1m ?...

$$\Phi_\varphi(\vec{\nu}) = 0.0228\ r_0^{-\frac{5}{3}} \left(\nu^2 + \frac{1}{\mathcal{L}_0^2}\right)^{-\frac{11}{6}}$$

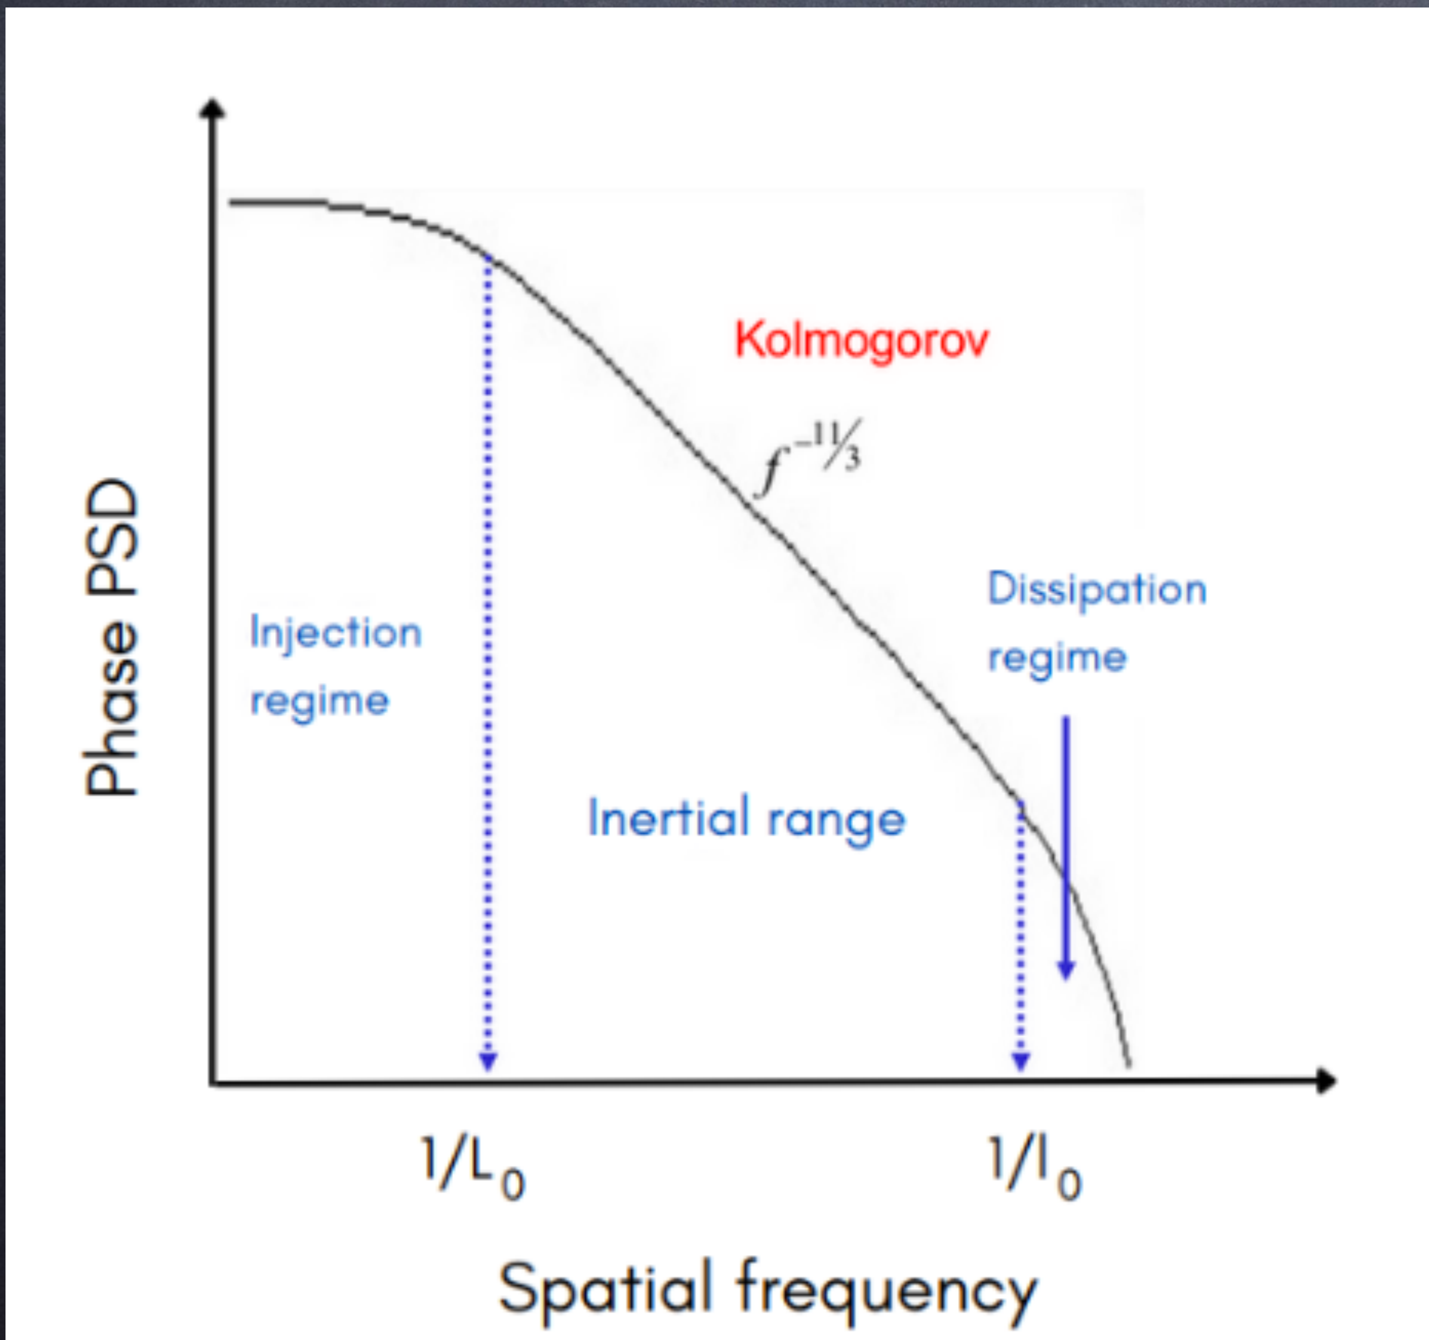
Power Spectral Density (PSD) of the phase, function of the spatial frequency

Kolmogorov/von Kármán model

- Kolmogorov : outerscale of turbulence $\mathcal{L}_0$ is infinite.
- One can refine the model by considering also ℓ_0.
- ∃ other models with a finite $\mathcal{L}_0$ (and a non-zero ℓ_0).

Images & turbulence — 13

$$\Phi_\varphi(\vec{\nu}) = 0.0228\; r_0^{-\frac{5}{3}} \left(\nu^2 + \frac{1}{\mathcal{L}_0^2}\right)^{-\frac{11}{6}}$$

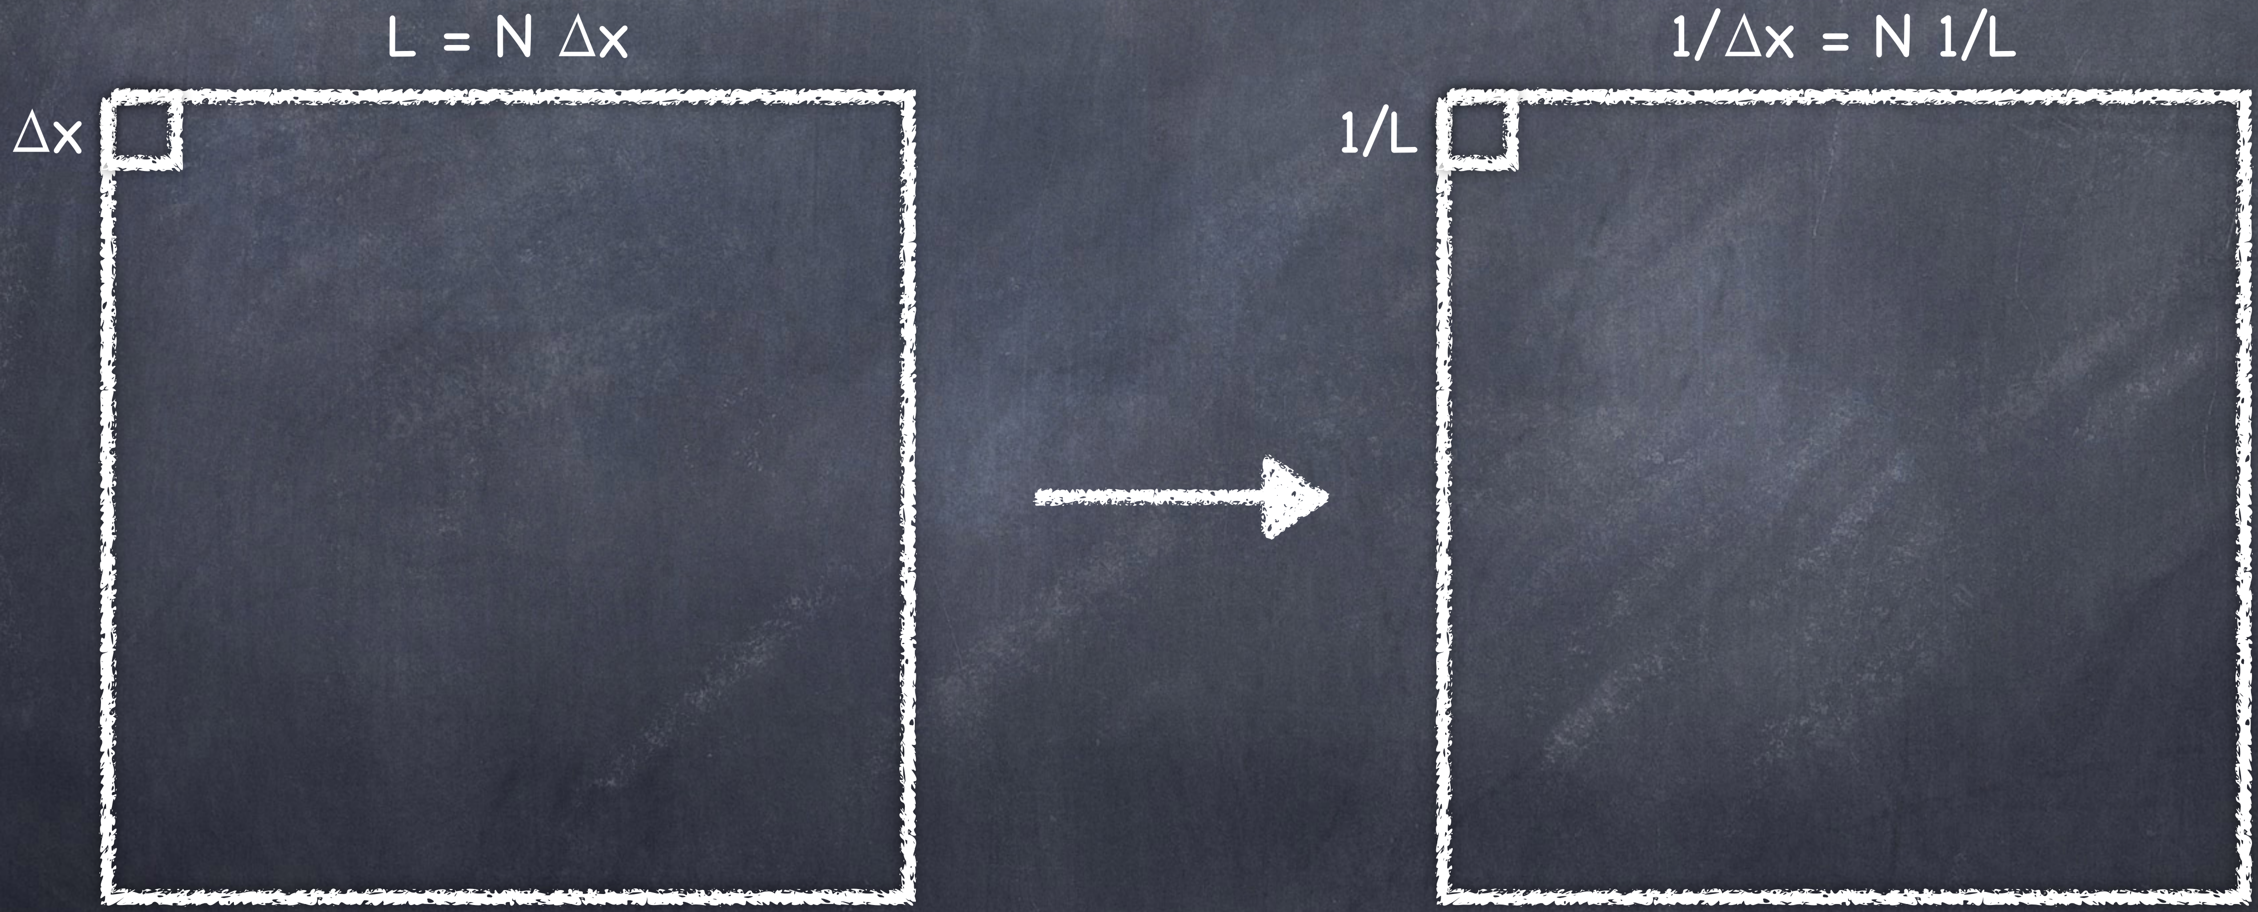


Energy cascade:

wind shear => turbulent energy injected into the system via a large eddy ($\mathcal{L}_0$) which splits into smaller and smaller eddies (ℓ_0), and is finally viscously dissipated.

Interval [ℓ_0, $\mathcal{L}_0$] = inertial range.

(A reminder of discrete Fourier transform (DFT)…)



Images & turbulence — 14

$$\Phi_\varphi(\vec{\nu}) = 0.0228\ r_0^{-\frac{5}{3}} \left(\nu^2 + \frac{1}{\mathcal{L}_0^2}\right)^{-\frac{11}{6}}$$

Which, numerically written, and by considering wavefronts made of ‘dim’ pixels corresponding to ‘L’ meters, becomes:
(re-writing - ``de-dimensionalizing” - the equation with L_0=L_0 L/L and ν=ν L/L…)

```
freq = findgen(dim)
dsp  = .0228*(L/r0)^(5/3.)*L^2*(freq^2+(L/L0)^2)^(-11./6)
```

And which (with the right frequency scale) can be plot with:

```
plot_oo, 1./L*findgen(dim), dsp, XR=[1/L/1.2,dim*1/L*1.2], /XS
```

=> make a function that computes PSD(L_0, r_0, dim, L) and plot it for different [r_0, L_0]… [with, for example: dim=1000, L=100., r0=0.1, L0=100.,10.,1.]

(IDL – 2)

Example of a function that computes the sum of two parameters:

```
function sum_of_two_parameters, par1, par2
result=par1+par2
return, result
end
```

Compile and run the function (written, e.g., in a file sum2.pro):

```
idl > .r sum2
—> % Compiled module: SUM_OF_TWO_PARAMETERS
idl > res = sum_of_two_parameters(2,1)
idl > print, res
—> 3
```
